Step 6: Run Machine learning code with notebooks Kaggle Notebooks share the use of data, code, and notebook Jupyter Notebooks on the same site Q: Will a MySQL connection between two computers with different Operating Systems work? If I have a MySQL connection between two computers using the default Windows authentication, will it work even if the computers are running different operating systems? A: You should be able to connect to a database with Windows Authentication from any machine regardless of the Operating System, provided you have the correct client tools installed on your target machine. The relevant question for this would be "How do I connect to a MySQL database using the Windows Authentication provided by a Windows Server?" The MySQL client-tools need to be installed on the client machine to support the Windows authentication, and it may be that your client machine doesn't have the required MySQL client software installed. A dramatic use of good design When a developer creates a website, they generally do not design the look and feel. There are some who have argued that this is the responsibility of the web designer, but this may not be the case. At Primoris, we believe that the key to a good design is that it should help the user get the job done in the least amount of time. In other words, a great design should work, and we are sure that it will. What if the website is designed by a developer, does the developer need to understand a little about design in order to get it right? Can all developers be expected to understand it? We think not, and here is why... Some developers work with clients to build functional web applications, so they create code using their best judgement about how a website should work. They might also be working with a visual designer to develop the look and feel of the site. While this might seem like an obvious area of overlap, the biggest problem is that the designer may be giving the developer instructions that are not relevant to the way the site should look. The developer might be fine with this, but in the end, it is not a design problem, it is a development problem. The designer's job is to work with the developer to build a site that will enhance the user's experience. This is their job. If they are unable to do this, they should get help. It is important to understand that a site is not a website. If 13e1b3768c
