It is known that from the population of  $A$  there are  $x$  people who have a deep voice, and the population of  $B$  is proportional to the population of  $A$ , i.e.  $B$  has  $1-\alpha$  of the population of  $A$ . a) Find the conditional probability that a random member of  $B$  has a deep voice given that the subject has a deep voice. I do not understand what a "random member of  $B$ " means. I believe that the event "has a deep voice" is of the form  $A$ . I.e. the random subject belongs to  $B$  so I have to multiply by  $1-\alpha$ ? And I need to find the conditional probability of this event? Or am I wrong and the event is  $A \cup B$ ? If so what should I do next? I do not understand the concept of "conditional probability". A: Given that the subject has a deep voice is equivalent to saying that  $A$  is in the set  $A \cup B$ . So,  $A \cup B$  is the event being considered. The conditional probability that a random member of  $B$  has a deep voice given that the subject has a deep voice is the proportion of random members of  $B$  who have a deep voice in the set  $A \cup B$ : 
$$\frac{\mathbf{P}(A \cup B) - \mathbf{P}(A)}{\mathbf{P}(A \cup B)}$$
 using the key information from the problem-reproducible models. In our previous works, we have learned from domain experts by domain-specific explanations (reproduc
