sony sonicstage 4.3 windows 7 12A blind man who suffered multiple severe burns after a fresh spring snow allegedly melted on him as he was sleeping has taken a legal action against the makers of Hotpoint washing machines. Harold Clarkson, 64, from Lancashire, has spent two years recovering from the burns. In February this year, Mr Clarkson had left his double bed, which was rolled up, at the back of a communal toilet of the assistance centre where he was staying. The following morning, when Mr Clarkson went to use the toilet, he had to step over his own bed where he had woken up and back to the door, almost tripping over the bed. As he was doing so, the freshly fallen snow that was on the floor of the toilet room froze and broke off, hitting him in the face. Mr Clarkson was taken to Lancaster Royal Infirmary, and due to the severity of the burns, has spent the last two years recovering in intensive care. He has applied for almost £30,000 in damages from the manufacturer of Hotpoint washing machines, the manufacturer of the toilet which he was injured in and the Government which he claims has a duty to manage the risk of fire in residential dwellings and should have had it done. Mr Clarkson claims the toilet did not have any warning lights or smoke detectors. He says that this is a clear breach of British Standard requirements for toilets and fire alarms and has asked the fire minister to carry out a review of all toilets to ensure they are fitted with these safety measures. Barrister David Pullen who represents Mr Clarkson, has stated: "Mr Clarkson has suffered devastating personal injuries as a result of the toilet incident in February 2012. He is now having to endure the financial strain of the court proceedings. The Supreme Court is expected to make a judgement in the case in the next 12 months." A spokesman for the Department of Communities and Local Government has refused to comment.Determination of amphetamine and its metabolites in urine by LC-MS/MS: a new approach to drug doping monitoring. We developed and validated a method for the quantitation of amphetamine and its metabolites by LC-MS/MS. The principal advantage of this method is its ability to detect and discriminate the four major amphetamines (AM), namely, dextro-, levo-, meta- and phenmetrazine, and four amphetamine-related drugs, namely, 3,4-methylenedio
